Show Code

Introduction

To see how commands work, use `Slides.docs()` to see the documentation. Here we will focus on using all that functionality to create slides.

> **Note**
>
> This is inline markdown parsed by magic

Version: 3.6.1 as executed from below code in markdown.

Python

```python
# get the slides instance under a python block in Markdown file, we will use it lat
myslides = get_slides_instance()
import ipyslides as isd
version = myslides.version
```

IPySlides Online Running Sources

Note

- Edit on Kaggle
- Launch example Notebook launch binder
- Watch a Youtube Video

1. Add references like this per slide. Use slides.cite() or in markdown citekey to add citations generally. ↩

IPython Display Objects

Any object with following methods could be in`write` command:

`_repr_pretty_`, `_repr_html_`, `_repr_markdown_`, `_repr_svg_`, `_repr_png_`, `_repr_jpeg_`, `_repr_latex_`, `_repr_json_`, `_repr_javascript_`, `_repr_pdf_` Such as IPython.display.[HTML,SVG,Markdown,Code] etc. or third party such as `plotly.graph_objects.Figure`.

Plots and Other Data Types

These objects are implemented to be writable in `write` command:

`matplotlib.pyplot.Figure`, `altair.Chart`, `pygal.Graph`, `pydeck.Deck`, `pandas.DataFrame`, `bokeh.plotting.Figure`, `IPython.display.Image` Many will be extentended in future. If an object is not implemented, use `display(obj)` to show inline or use library's specific command to show in Notebook outside `write`.

Interactive Widgets

Any object in `ipywidgets` Link to ipywidgtes right here using textbox command

or libraries based on ipywidgtes such as bqplot, ipyvolume, plotly's `FigureWidget` [1]

(reference at end) can be included as well.

Commands which do all Magic!

Slides.**write**(*objs, widths=None)

Write `objs` to slides in columns. To create rows in a column, wrap objects in a list or tuple. You can optionally specify `widths` as a list of percentages for each column.

Write any object that can be displayed in a cell with some additional features:

- Strings will be parsed as as extended markdown that can have citations/python code blocks/Javascript etc.
- Display another function in order by passing it to a lambda function like `lambda: func()`. Only body of the function will be displayed/printed. Return value will be ignored.
- Dispaly IPython widgets such as `ipywidgets` or `ipyvolume` by passing them directly.
- Display Axes/Figure form libraries such as `matplotlib`, `plotly` `altair`, `bokeh`, `ipyvolume` ect. by passing them directly.
- Display source code of functions/classes/modules or other languages by passing them directly or using `Slides.code` API.

Plotting with Matplotlib

Python

```python
sl.set_css({'background':'linear-gradie

import numpy as np, matplotlib.pyplot a
plt.rcParams['svg.fonttype'] = 'none' #
x = np.linspace(0,2*np.pi)
with plt.style.context('ggplot'):
    fig, ax = plt.subplots(figsize=(3.4
    _ = ax.plot(x,np.cos(x))
write(ax, s.focus_lines([0,3,4]))
```

Writing Pandas DataFrame

	sepal_length	sepal_width	petal_length	petal_width
count	150.000000	150.000000	150.000000	150.000000
mean	5.843333	3.057333	3.758000	1.199333
std	0.828066	0.435866	1.765298	0.762238
min	4.300000	2.000000	1.000000	0.100000
25%	5.100000	2.800000	1.600000	0.300000
50%	5.800000	3.000000	4.350000	1.300000
75%	6.400000	3.300000	5.100000	1.800000
max	7.900000	4.400000	6.900000	2.500000

Python

```python
try:
    import pandas as pd
    df = pd.read_csv('https://raw.githubusercontent.com/mwaskom/seaborn-data/master
    df = df.describe() #Small for display
except:
    df = '### Install `pandas` to view output'
```

Writing Plotly Figure

Interactive Apps with Widgets

Use `ipywidgets`, `bqplot`,`ipyvolume`, `plotly` `Figurewidget` etc. to show live apps like this!

> 💡 Tip
>
> Export to Slides/Report to see what happens to this slide and next slide!

Python

```python
import ipywidgets as ipw

write('''
    ## Interactive Apps with Widgets se
    Use `ipywidgets`, `bqplot`,`ipyvolu
     ::: note-tip
         Export to Slides/Report to see
    ''')
plot_html = ipw.HTML('Plot will be here
```

Dynamic Content without Widgets

Use refresh button below to update plot! Compare with previous slide!

A Silly Plot

Python

```python
write('''
    ## Dynamic Content without Widgets
    Use refresh button below to update
    ''')

def display_plot(): return race_plot().

write(lambda: slides.on_refresh(display
slides.code.cast(race_plot).display()
```

Python

```python
def race_plot():
    import numpy as np
```

Displaying image from url from somewhere in Kashmir (کشمیر)

Watching Youtube Video?

Want to do some drawing instead? Click on pencil icon and draw something on tldraw!

Python

```python
write(f"### Watching Youtube Video?")
```

Block API

New `block` API is as robust as `write` command. On top of it, it makes single unit of related content.

Table

h1	h2	h3
d1	d2	d3
r1	r2	r3

Widgets

Click to do nothing

Python

```python
write('## Block API\nNew `block` API is as robust as `write` command. On top of it,
slides.block_red(
    [
        '### Table',
        '''
```

$\LaTeX$ in Slides

Use $ $ or $$ $$ to display latex in Markdown, or embed images of equations $\LaTeX$ needs time to load, so keeping it in view until it loads would help.

LaTeX in Slides

Use $ $ or $$ $$ to display latex in Markdown, or embed images of equations LaTeX needs time to load, so keeping it in view until it loads would help.

$$\int_0^1 \frac{1}{1-x^2}\,dx$$

LaTeX in Slides

Use $ $ or $$ $$ to display latex in Markdown, or embed images of equations LaTeX needs time to load, so keeping it in view until it loads would help.

$$\int_0^1 \frac{1}{1-x^2}\,dx$$

$$ax^2 + bx + c = 0$$

Python

```python
slides.write('## Built-in CSS styles')
slides.css_styles.display()
```

Built-in CSS styles

Use any or combinations of these styles in className argument of writing functions:

className	Formatting Style
'text-[value]'	[value] should be one of tiny, small, big, large, huge.
'align-[value]'	[value] should be one of center, left, right.
'rtl'	——— اردو عربی
'info'	Blue text. Icon ℹ️ for note-info class.
'tip'	Blue Text. Icon 💡 for note-tip class.
'warning'	Orange Text. Icon ⚠️ for note-warning class.
'success'	Green text. Icon ✅ for note-success class.
'error'	Red Text. Icon ⚡ for note-error class.
'note'	📝 Text with note icon.
'slides-only'	Text will not appear in exported html report.
'report-only'	Text will not appear on slides. Use to fill content in report

Serialize Custom Objects to HTML

This is useful for displaying user defined/third party objects in slides

0 1 2 3 4 5 6 7 8 9

Python

```python
slides.write('## Serialize Custom Objects to HTML\nThis is useful for displaying us
with slides.suppress_stdout(): # suppress stdout from register fuction below
    @slides.serializer.register(int)
    def colorize(obj):
        color = 'red' if obj % 2 == 0 else 'green'
        return f'<span style="color:{color};">{obj}</span>'
    slides.write(*range(10))

some_slide.get_source().display()
```

This is all code to generate slides

Python

```python
def demo(self):
    "Demo slides with a variety of content."
    from ..._demo import demo_slides
    return demo_slides(self)
```

e:\development\ipyslides\ipyslides_demo.py

```python
# Author: Abdul Saboor
# This demonstrates that you can generate slides from a .py file too, which you can

from ipyslides.formatters import libraries, supported_reprs

def demo_slides(slides):
    slides.close_view() # Close any previous view to speed up loading 10x faster or
    slides.clear() # Clear previous content
    raw_source = slides.code.cast(__file__).raw
```

📝 Note

Slides keep their full code if they are not made by @frames decorator!

Source Code

Markdown: Slide 0

```
