IPySlides 3.7.5 Documentation

Creating slides with IPySlides

Abdul Saboor[1], Unknown Author[2]

May 03, 2024

[1]My University is somewhere in the middle of nowhere
[2]Their University is somewhere in the middle of nowhere

Table of contents

This is summary of current section

Oh we can use inline columns

Column A   Column B

here and what not!

Markdown

```
1  ```toc Table of contents
2  Extra content for current section which is on right
3  ```
```

Main App

Slides(extensions=[], auto_focus=True)

Interactive Slides in IPython Notebook. Only one instance can exist. `auto_focus` can be reset from settings and enable jumping back to slides after a cell is excuted.

To suppress unwanted print from other libraries/functions, use:

```python
1  with slides.suppress_stdout():
2      some_function_that_prints() # This will not be printed
3      print('This will not be printed either')
4      display('Something') # This will be printed
```

> ✨ Info
>
> The methods under settings starting with `Slides.settings.set_` returns settings back to enable chaining without extra typing, like `Slides.settings.set_animation().set_layout()....`

> 💡 Tip
>
> - Use `Slides.instance()` class method to keep older settings. `Slides()` apply default settings every time.
> - Run `slides.demo()` to see a demo of some features.
> - Run `slides.docs()` to see documentation.

Adding Slides

> 📝 **Note**
> Besides functions below, you can add slides with `%%title`/`%%slide` magics as well.

Slides.**title**()

Use this context manager to write title. It is equivalent to `%%title` magic.

Slides.**slide**()

Slides.**frames**(slide_number, *objs, repeat=False)

Decorator for inserting frames on slide, define a function with two arguments acting on each obj in objs and current frame index. You can also call it as a function, e.g. `.frames(1,*objs)()` becuase it can write by defualt.

```python
1  @slides.frames(1,a,b,c) # slides 1.1, 1.2, 1.3 with content a,b,c
2  def f(obj, idx):
3      do_something(obj)
4      if idx == 0: # Main Slide
5          print('This is main slide')
6      else:
7          print('This is frame', idx)
8
9  slides.frames(1,a,b,c)() # Auto writes the frames with same content as above
```

Python

```python
1  self.write(self.fmt('`{self.version!r}` `{self.xmd_syntax}`'))
```

'3.7.5'

Extended Markdown

Extended syntax for markdown is constructed to support almost full presentation from Markdown.

Following syntax works only under currently building slide:

- notes\`This is slide notes\` to add notes to current slide
- cite\`key\` to add citation to current slide. citations are automatically added in suitable place and should be set once using `Slides.set_citations` function.
- With citations mode set as 'footnote', you can add refs\`ncol\` to add citations anywhere on slide. If ncol is not given, it will be picked from layout settings.
- section\`content\` to add a section that will appear in the table of contents.
- toc\`Table of content header text\` to add a table of contents. For block type toc, see below.
- proxy\`placeholder text\` to add a proxy that can be updated later with `Slides.proxies[index].capture` contextmanager. Useful to keep placeholders for plots in markdwon.
- peoxy\`[Button Text]\` to add a proxy that can be replaced by pasting image from clipboard later.
- Triple dashes `---` is used to split markdown text in slides inside `from_markdown(start, content)` function.
- Double dashes `--` is used to split markdown text in frames

Adding Content

> 📝 Note
> Besides functions below, you can add content to slides with %%xmd,%xmd as well.

Slides.**write**(*objs, widths=None)

Write `objs` to slides in columns. To create rows in a column, wrap objects in a list or tuple. You can optionally specify `widths` as a list of percentages for each column.

Write any object that can be displayed in a cell with some additional features:

- Strings will be parsed as as extended markdown that can have citations/python code blocks/Javascript etc.
- Display another function in order by passing it to a lambda function like `lambda: func()`. Only body of the function will be displayed/printed. Return value will be ignored.
- Dispaly IPython widgets such as `ipywidgets` or `ipyvolume` by passing them directly.
- Display Axes/Figure form libraries such as `matplotlib`, `plotly altair`, bokeh, `ipyvolume` ect. by passing them directly.
- Display source code of functions/classes/modules or other languages by passing them directly or using `Slides.code` API.
- Use `Slides.alt(widget, func)` function to display widget on slides and alternative content in exported slides, function should return possible HTML representation of widget.
- `ipywidgets.HTML` and its subclasses will be displayed as `Slides.alt(widget, html_converter_func)`. The value of exported HTML will be most recent.

Adding Speaker Notes

Skip to Dynamic Content

> 📝 Note
>
> You can use notes`notes content ` in markdown.

> ⚡ Danger
>
> This is experimental feature, and may not work as expected.

Slides.notes.**display**()

Slides.notes.**insert**(content)

Add notes to current slide. Content could be any object except javascript and interactive widgets.

> 💡 Tip
>
> In markdown, you can use notes`notes content.`

Displaying Source Code

Slides.code.**cast**(obj, language='python', name=None, **kwargs)

Create source code object from file, text or callable. kwargs are passed to
`ipyslides.formatter.highlight`.

Slides.code.**context**(returns=False, **kwargs)

Execute and displays source code in the context manager. kwargs are passed to
`ipyslides.formatter.highlight` function. Useful when source is written inside context manager
itself. If `returns` is False (by default), then source is displayed before the output of code. Otherwise
you can assign the source to a variable and display it later anywhere.

Usage:

```
1  with source.context(returns = True) as s: #if not used as `s`, still it is stored `s
2      do_something()
3      write(s) # or s.display(), write(s)
4
5  #s.raw, s.value are accesible attributes.
6  #s.focus_lines, s.show_lines are methods that are used to show selective lines.
```

Slides.code.**from_callable**(callable, **kwargs)

Returns source object from a given callable [class,function,module,method etc.] with show_lines

Contents

Layout and Theme Settings

Slides.settings.**get_footer**(slide, update_widget=False)

Get footer text. `slide` is a slide object.

Slides.settings.**set_animation**(main='slide_h', frame='appear')

Set animation for slides and frames.

Slides.settings.**set_bg_image**(src=None, opacity=0.25, blur_radius=None)

Adds glassmorphic effect to the background with image. `src` can be a url or a local image path.

Slides.settings.**set_code_theme**(style='default', color=None, background=None, hover_color='var(--hover-bg)', lineno=True)

Set code style CSS. Use background for better view of your choice. This is overwritten by theme change.

Slides.settings.**set_css**(css_dict={})

Set CSS for all slides. This loads on slides navigation, so you can include keyframes animations as well. Individual slide's CSS set by `slides[index].set_css` will override this. `css_dict` is a nested dict of css selectors and properties. There are few special rules in `css_dict`:

- All nested selectors are joined with space, so '.A': **{**'.B': ... **}** becomes '.A .B **{...}**' in CSS.

Useful Functions for Rich Content

Slides.**clipboard_image**(filename, quality=95, overwrite=False)

Save image from clipboard to file with a given quality. On next run, it loads from saved file under `notebook-dir/.ipyslides-assets/clips`. Useful to add screenshots from system into IPython. You can use overwite to overwrite existing file. You can add saved clips using a "clip:" prefix in path in `Slides.image("clip:filename.png")` function and also in markdown.

- Output can be directly used in `write` command.
- Converts to PIL image using `.to_pil()`.
- Convert to HTML representation using `.to_html()`.
- Convert to Numpy array using `.to_numpy()` in RGB format that you can plot later.

Slides.**alt**(widget, func)

Display `widget` for slides and output of `func(widget)` will be and displayed only in exported formats as HTML. `func` should return possible HTML representation (provided by user) of widget as string.

Python

```python
1  import ipywidgets as ipw
2  slides = get_slides_instance()
3  slides.alt(ipw.IntSlider() lambda w: f'<input type="range" min="{w.min}" max="{w.max}
```

Citations and Sections

Use syntax citekey` `to add citations which should be already set by `Slides.set_citations(data,` `mode)` method. Citations are written on suitable place according to given mode. Number of columns in citations are determined by `Slides.settings.set_layout(..., ncol_refs = int)`.[1]

Add sections in slides to separate content by section`text.` Corresponding table of contents can be added with toc`title`/`toc title\n summary of current section \n`.

Slides.**set_citations**(data, mode='footnote')

Set citations from dictionary or file that should be a JSON file with citations keys and values, key should be cited in markdown as cite`key.` mode for citations should be one of ['inline', 'footnote']. Number of columns in citations are determined by `Slides.settings.set_layout(...,` `ncol_refs=N)`.

> 📝 Note
>
> - You should set citations in start if using voila or python script. Setting in start in notebook is useful as well.
> - Citations are replaced with new ones, so latest use of this function reprsents avilable citations.

1. Citation A

Dynamic Content

Slides.**on_refresh**(func)

Decorator for inserting dynamic content on slide, define a function with no arguments. Content updates when `slide.update_display` is called or when `Slides.refresh` is called.

> 💡 Tip
>
> You can use it to dynamically fetch a value from a database or API while presenting, without having to run the cell again.

> 📝 Note
>
> - No return value is required. If any, should be like `display('some value')`, otherwise it will be ignored.
> - A slide with dynamic content enables a refresh button in bottom bar.
> - All slides with dynamic content are updated when refresh button in top bar is clicked.
Python

```python
import time
slides = get_slides_instance() # Get slides instance, this is to make doctring runno
source.display() # Display source code of the block
@slides.on_refresh
def update_time():
    print('Local Time: {3}:{4}:{5}'.format(*time.localtime())) # Print time in HH:MI
```

Content Styling

You can **style** or **colorize** your *content* and <mark>*text*</mark>. Provide **CSS** for that using `.format_css` or use some of the available styles. See these **styles** with `.css_styles` property as below:

```
Use any or combinations of these styles in className argument of writing functions:

className            | Formatting Style
=====================================================================
'text-[value]'       | [value] should be one of tiny, small, big, large, huge.
'align-[value]'      | [value] should be one of center, left, right.
'rtl'                | ─────── اردو عربی
'info'               | Blue text. Icon i  for note-info class.
'tip'                | Blue Text. Icon 💡 for note-tip class.
'warning'            | Orange Text. Icon ⚠️ for note-warning class.
'success'            | Green text. Icon ✅ for note-success class.
'error'              | Red Text. Icon ⚡ for note-error class.
'note'               | 📝 Text with note icon.
'export-only'        | Hidden on main slides, but will appear in exported slides.
'jupyter-only'       | Hidden on exported slides, but will appear on main slides.
'block'              | Block of text/objects
'block-[color]'      | Block of text/objects with specific background color from red,
                     | green, blue, yellow, cyan, magenta and gray.
```

Python

```
1  self.write(('You can **style**{.error} or **color[teal]`colorize`** your *content*{:
2        'Provide **CSS**{.info} for that using `.format_css` or use some of the avai
3        'See these **styles**{.success} with `.css_styles` property as below:'))
```

Highlighting Code

pygments is used for syntax highlighting [1]. You can **highlight** code using `highlight` function [2] or within markdown like this:

Python

```python
1  import ipyslides as isd
```

Javascript

```javascript
1  import React, { Component } from "react";
```

Markdown

```markdown
1   ## Highlighting Code
2   [pygments](https://pygments.org/) is used for syntax highlighting cite`A`.
3   You can **highlight**{.error} code using `highlight` function cite`B` or within m
4   ```python
5   import ipyslides as isd
6   ```
7   ```javascript
8   import React, { Component } from "react";
9   ```
10  proxy`source code of slide will be updated here later using slide_handle.proxies
```

---

1. Citation A   2. Citation B

Loading from File/Exporting to HTML

> 📝 **Note**
> You can parse and view a markdown file. The output you can save by exporting notebook in other formats.

Slides.**sync_with_file**(start, path, trusted=False, interval=500)

Auto update slides when content of markdown file changes. You can stop syncing using `Slides.unsync` function. interval is in milliseconds, 500 ms default. Read `Slides.from_markdown` docs about content of file.

The variables inserted in file content are used from top scope.

Slides.**from_markdown**(start, content, trusted=False)

You can create slides from a markdown tex block as well. It creates slides `start + (0,1,2,3...)` in order. You should add more slides by higher number than the number of slides in the file/text, or it will overwrite.

- Slides separator should be --- (three dashes) in start of line.
- Frames separator should be -- (two dashes) in start of line. All markdown before first `--` will be written on all frames.
- In case of frames, you can add `%++` (percent plus plus) in the content to add frames incrementally.
- You can use frames separator (--) inside `multicol` to make columns span multiple frames with

Contents

Adding User defined Objects/Markdown Extensions

I will be on exported slides

Python
```python
 1  self.write('## Adding User defined Objects/Markdown Extension
 2  self.write(
 3      lambda: display(self.html('h3','I will be on main slides'
 4      metadata = {'text/html': '<h3 class="warning">I will be o
 5      s.get_source(), widths = [1,3]
 6  )
 7  self.write('If you need to serialize your own or third party
 8  self.doc(self.serializer,'Slides.serializer', members = True,
 9  self.write('**You can also extend markdown syntax** using `ma
10  self.doc(self.extender,'Slides.extender', members = True, its
```

> 📝 Note
>
> If you need to serialize your own or third party objects not serialized by this module, you can use
> @Slides.serializer.register to serialize them to html.

Slides.serializer.display(obj)
Display an object with metadata if a serializer available. Same as display(obj, metadata =
serializer.get_metadata(obj)))

Slides.serializer.get_func(obj_type)

Get serializer function for a type. Returns None if not found

Keys and Shortcuts

- You can use `Slides.current` to access a slide currently in view.
- You can use `Slides.running` to access the slide currently being built, so you can set CSS, aminations etc.

Shortcut	Button	Action
␣ / ▸	⟩, ⌄	Move to next slide
Ctrl + ␣ / ◂	⟨, ⌃	Move to previous slide
Ctrl + 0 / 0	⤆ / ⤇	Jump to Star/End of slides
Ctrl + [1-9]/ [1-9]		Shift [1-9] slides left/right
Z	⊕, ⊖	Toggle objects zoom mode
S	⊙	Take screenshot
F	⤢, ⤧	Toggle fullscreen
Esc		Exit fullscreen
V	▭, ⧉	Toggle fit to viewport [voila only]
G	⚙, ✕	Toggle settings panel
E	</>	Edit Source Cell of Current Slide
L	◉, ○	Toggle LASER pointer
K		Show keyboard shortcuts

Focus on what matters

- There is a zoom button on top bar which enables zooming of certain elements. This can be toggled by Z key.
- Most of supported elements are zoomable by default like images, matplotlib, bokeh, PIL image, altair plotly, dataframe, etc.
- You can also enable zooming for an object/widget by wrapping it inside `Slide.enable_zoom` function conveniently.
- You can also enable by manully adding `zoom-self`, `zoom-child` classes to an element. To prevent zooming under as `zoom-child` class, use `no-zoom` class.

Focus on Me 😎

- If zoom button is enabled, you can hover here to zoom in this part!
- You can also zoom in this part by pressing Z key while mouse is over this part.

SVG Icons

Icons that apprear on buttons inslides (and their rotations) available to use in your slides as well.

chevron: ❯ pencil: ✏ bars: ☰ arrow: → arrow-bar: ↗ close: ✕ dots: ⋮ expand: ⤢ compress: ⤡ camera: ◉ play: ▶ pause: ❚❚ stop: ■ loading: ◠ circle: ○ info: ⓘ refresh: ↻ laser: ◉ zoom-in: ⊕ zoom-out: ⊖ search: ⌕ code: </> win-maximize: ▢ win-restore: ❐ rows: ☰ columns: ⊞ settings: ✿

Python

```python
1  import ipywidgets as ipw
2  btn = ipw.Button(description='Chevron-Down',icon='plus').add_class('MyIcon') # Any 
3  self.write(btn)
4  self.format_css({'.MyIcon .fa.fa-plus': self.icon('chevron',color='crimson', size='1
```

Auto Slide Numbering in Python Scripts

Slides.**AutoSlides**()

Returns a named tuple `AutoSlides(get_next_number, title,slide,frames, from_markdown)` if run from inside a python script. Functions inside this tuple replace main functions while removing the 'slide_number' paramater. Useful to handle auto numbering of slides inside a sequntially running script. Call at top of script before adding slides.

> ⚠️ Alert
>
> Returns None in Jupyter's context and it is not useful there due to lack of sequence.

```python
1  import ipyslides as isd
2  slides = isd.Slides()
3  auto = slides.AutoSlides() # Call at top of script
4
5  with auto.slide() as s:
6      slides.write(f'This is slide {s.number}')
```

Use `auto.title`, `auto.slide` contextmanagers, `auto.frames` decorator and `auto.from_markdown` function without thinking about what should be slide number.

Presentation Code

Python

```python
 1  def docs(self):
 2      "Create presentation from docs of IPySlides."
 3      self.close_view() # Close any previous view to speed up loading 10x faster on a
 4      self.clear() # Clear previous content
 5      self.create(*range(23)) # Create slides faster
 6
 7      from ..core import Slides
 8
 9      self.set_citations({'A': 'Citation A', 'B': 'Citation B'}, mode = 'footnote')
10      self.settings.set_footer('IPySlides Documentation')
11
12      auto = self.AutoSlides() # Does not work inside notebook (should not as well)
13
14      with auto.title(): # Title
15          self.write(f'## IPySlides {self.version} Documentation\n### Creating slides
```
